

SECTION D-D
SCALE 3 : 1

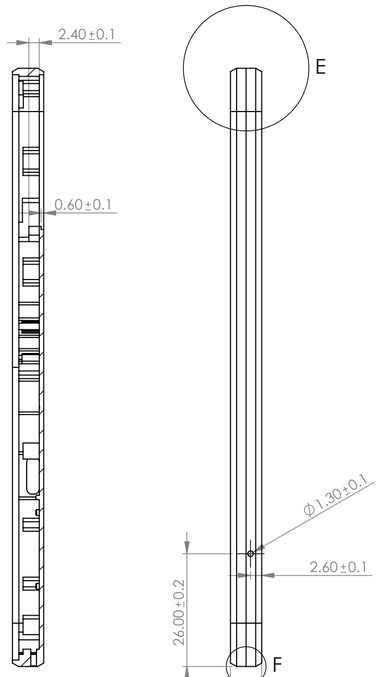

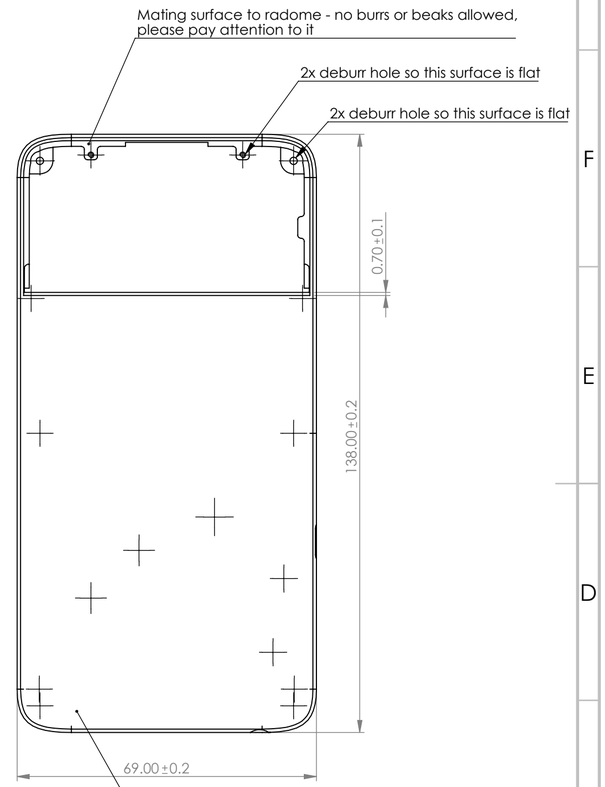

DETAIL C
SCALE 3 : 1

DETAIL E
SCALE 3 : 1

Two types of material, with a different surface finish for each:

7075 aluminum material
- dark gray anodized
- fine matte texture
- Ra0.4 or better
- No tooling marks visible

SUS304 stainless steel
- Gloss black PVD finish
- High-grade mirror polish

No water marks or streaks allowed on either material finish.

Lip height matches front bezel PCB.
It is critical that the front bezel material and lip height are matched to within 0.1mm. The height of the bezel is fixed by the PCB maker, so this height must be adjusted in CNC to match it.

Lip width matches front bezel with a gap of 0.15mm. It is critical that the bezel and the internal lip are well-matched. For QC, take a reference front bezel and fit it into the case. It should fit freely, but without more than the specified gap.

SECTION A-A
SCALE 2 : 1

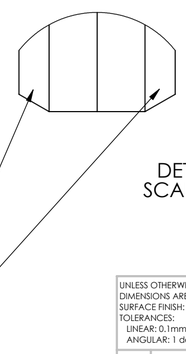

SECTION B-B

Top and bottom edge chamfer is single-crystalline diamond cut. The finish of the cut will be a high polish.

This cut is to be done after any polishing/grinding to the case, but before the anodization or PVD step.

Do not cut this before polishing.

To maintain precision:
- A custom jig is required to hold the material
- Burrs should be removed from the inside, to avoid offset of the chamfer due to extra material against the jig
- The jig surface must be kept clean and free of tailings
